HEXA- AND HEPTAPEPTIDE ANAPHYLATOXIN-RECEPTOR LIGANDS

5

Technical Field

This invention relates to organic compounds that modulate anaphylatoxin activity. It also relates to methods and compositions for modulating anaphylatoxin activity in human and animal hosts in need of such treatment.

Background of the Invention

A wide variety of conditions including infection by bacteria, viruses or fungi, infiltration by cancer cells, allergic or autoimmune disorders and physically- or chemically-induced trauma causes an inflammatory response in humans. In all of these diseases and conditions in man and in most mammals, activation of the complement system (a set of proteins, regulatory factors and proteolytic enzymes) via either the classical or the alternative pathway results in the generation of biologically active peptides which serve to amplify and exacerbate the resulting inflammation. The most active peptide, anaphylatoxin C5a, a 74-amino acid polypeptide, is generated by cleavage of the alpha-chain of native C5 at a specific site by convertases (proteolytic enzymes) of the blood complement system as well as by enzymes of the coagulation system. C5a exists *in vivo* in two biologically active forms. Once it is liberated from C5, the carboxyl terminal arginine of C5a is rapidly removed by carboxypeptidase-N, leaving the des-Arg derivative. Although C5a des-Arg is less active than C5a, both are potent inflammatory mediators at concentrations likely to be

generated *in vivo* (Fernandez, H. N.; Henson, P. M.; Otani, A.; Hugli, T. E. *J. Immunol.* 1978, 120, 109.). Together, these peptides along with C3a, C4a, and their des-Arg degradation products, collectively described herein as anaphylatoxin, are capable of triggering diverse inflammatory reactions.

Among the various cell types, the neutrophil response to C5a is the best defined. Cell surface receptors specific for C5a have been demonstrated on the neutrophil (Chenoweth, D. E.; Hugli, T. E. *Proc. Natl. Acad. Sci. U.S.A.* 1978, 75, 3943-3947. Huey, R.; Hugli, T. E. *J. Immunol.* 1985, 135, 2063-2068. Rollins, T. E.; Springer, M. S. *J. Biol. Chem.* 1985, 260, 7157-7160.), and the ligand-receptor interaction promotes human polymorpho-nuclear leukocyte (PMN) migration in a directed fashion (chemotaxis), adherence, oxidative burst, and granular enzyme release from these cells (Hugli, T. E. *Springer Semin. Immunopathol.* 1984, 7, 193-219.). The interaction of C5a with PMN and other target cells and tissues results in increased histamine release, vascular permeability, smooth muscle contraction, and an influx into tissues of inflammatory cells, including neutrophils, eosinophils, and basophils (Hugli, T. E. *Springer Semin. Immunopathol.* 1984, 7, 193-219.). C5a may also be important in mediating inflammatory effects of phagocytic mononuclear cells that accumulate at sites of chronic inflammation (Allison, A. C.; Ferluga, J.; Prydz, H.; Scherlemmer, H. U. *Agents and Actions* 1978, 8, 27.). C5a and C5a des-Arg can induce chemotaxis in monocytes (Ward, P. A. *J. Exp. Med.* 1968, 128, 1201. Snyderman, R.; Shin, H. S.; Dannenberg, A. C. *J. Immunol.* 1972, 109, 896.) and cause them to release lysosomal enzymes (McCarthy, K.; Henson, P. S. *J. Immunol.* 1979, 123, 2511.) in a manner analogous to the neutrophil

responses elicited by these agents. Recent studies suggest that C5a may have an immunoregulatory role by enhancing antibody particularly at sites of inflammation (Morgan, E. L.; Weigle, W. O.; Hugli, T. E. *J. Exp. Med.* 1982, 155, 1412. Weigle, W. O.; Morgan, E. L.; Goodman, M. G.; Chenoweth, D. E.; Hugli, T. E. *Federation Proc.* 1982, 41, 3099. Morgan, E. L.; Weigle, W. O.; Hugli, T. E. *Federation Proc.* 1984, 43, 2543.).

C5a and C5a des-Arg play important roles in host defenses against bacterial infections and possibly in the mediation of some pathologic lesions such as the leukocyte infiltration seen in the lungs during acute respiratory distress syndrome. This mechanism seems to play a role in different pathological situations like pulmonary distress during hemodialysis, leukophoresis, cardiopulmonary bypass, and in acute myocardial infarction. Complement activation has been postulated to play an important pathological role in rheumatoid arthritis, serum sickness, systemic lupus erythematosus, ulcerative colitis, and forms of hepatic cirrhosis, chronic hepatitis, and glomerulonephritis, in certain shock states, during hemodialysis, and cardiopulmonary bypass, acute pancreatitis, myocardial infarction (which may be worsened by C5a-induced leuko-embolization following the interaction of complement with atheromatous plaques), asthma, bronchoconstriction, some auto-allergic diseases, transplant rejection, and post-viral encephalopathies.

By serving as antagonists by binding to and blocking the anaphylatoxin receptor, certain compounds of the present invention can reduce or prevent anaphylatoxin-mediated inflammation. Other compounds of the present invention are

agonists that mimic anaphylatoxin activity, and assist the body in building its defense mechanism against invasion by infectious agents and malignancy. Additionally, these compounds may influence the immunoregulatory effects of anaphylatoxin. The possible involvement of anaphylatoxin in a wide range of diseases, as indicated by these examples, suggests that anaphylatoxin receptor ligands could have clinical applications for the treatment and prevention of the above-mentioned pathological conditions.

Detailed Description

As discussed above, C5a is the most active of a class of biologically active peptides which serve to amplify and exacerbate inflammation. While C5a contains 74 amino acid residues, it has been found in accordance with the present invention that oligopeptides containing as few as six amino acid residues are also actively bound by C5a receptors. Moreover, it has been found that peptidomimetic compounds (i.e. compounds which mimic the activity of peptides) in which certain groups replace the α -carbon in oligopeptides are also actively bound by C5a receptors.

Method of Treatment

The compounds of the present invention serve to modulate the activity of anaphylatoxin. Certain compounds of the present invention function as anaphylatoxin antagonists, while others function as agonists. The antagonist compounds of the present invention block the anaphylatoxin receptor and prevent anaphylatoxin activity, which makes those compounds useful in the treatment and prevention of injurious conditions or diseases in which anaphylatoxin may be involved. Disease states in which anaphylatoxin is involved include asthma, bronchial allergy, chronic inflammation, systemic lupus erythematosus, vasculitis, serum sickness, angioedema, rheumatoid arthritis, osteoarthritis, gout, bullous skin diseases, hypersensitivity pneumonitis, idiopathic pulmonary fibrosis, immune complex-mediated glomerulonephritis, psoriasis, allergic rhinitis, adult respiratory distress syndrome, acute pulmonary disorders, endotoxin shock, hepatic cirrhosis, pancreatitis, inflammatory bowel diseases (including Crohn's disease and ulcerative colitis), thermal injury, Gram-negative sepsis, necrosis in myocardial infarction, leukophoresis, exposure to medical devices (including but not limited to hemodialyzer membranes and extracorporeal blood circulation equipment), chronic hepatitis, transplant rejection, post-viral encephalopathies, and/or ischemia induced myocardial or brain injury. These compounds may also be used as prophylactics for such conditions as shock accompanying Dengue fever. In addition, a combination of antibiotic and anti-inflammatory

30

agent such as corticosteroids (e.g., methylprednisolone) and one or more of the above mentioned compounds may be employed.

Certain compounds of the invention are useful therapeutic agents because of their ability to mimic or
5 promote anaphylatoxin activity and are therefore useful in stimulating the inflammatory response and immune response in mammals who are deficient in this regard. These agonist compounds may be used to assist the body in building its defense mechanism against invasion by infectious
10 microorganisms or other stress. Interaction by these agonists at the anaphylatoxin receptor makes them useful in treating conditions or diseases including, but not limited to cancers (including but not limited to lung carcinoma), immunodeficiency diseases, and severe infections.

15 In some cases this will involve preventing the underlying cause of the disease state and in other cases, while the underlying disease will not be affected, the compounds of this invention will have the benefit of ameliorating the symptoms or preventing the manifestations of
20 the disease.

The compounds of the present invention may be administered orally, parenterally, by inhalation spray, rectally, or topically in dosage unit formulations containing conventional nontoxic pharmaceutically acceptable carriers,
25 adjuvants and vehicles as desired.

The term "parenteral" as used herein includes subcutaneous, intravenous, intramuscular, intrasternal, intra-arterial injection or infusion techniques, without limitation. The term "topically" encompasses administration
30 rectally and by inhalation spray, as well as by the more common routes of the skin and the mucous membranes of the mouth and nose.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention may be varied so as to achieve the desired therapeutic response for a particular patient, compositions, and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated, and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required for to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

Generally dosage levels of about 0.001 mg to about 100 mg, more typically from about 0.1 mg to about 20 mg, of active compound per kilogram of body weight per day are administered daily to a mammalian host. If desired, the effective daily dose may be divided into multiple doses for purposes of administration, e.g. two to four separate doses per day.

Formulation of Pharmaceutical Composition

Pharmaceutical compositions of this invention for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol, and the like), and suitable mixtures thereof, vegetable oils (such as olive oil), and injectable organic esters such as ethyl oleate. Proper

fluidity can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants.

5 These compositions may also contain adjuvants such as preservative, wetting agents, emulsifying agents, and dispersing agents. Prevention of the action of
microorganisms may be ensured by the inclusion of various
antibacterial and antifungal agents, for example, paraben,
10 chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic agents such as sugars, sodium chloride, and the like. Prolonged absorption of the injectable pharmaceutical form may be brought about by the inclusion of agents which delay absorption such as aluminum
15 monostearate and gelatin.

If desired, and for more effective distribution, the compounds can be incorporated into slow release or targeted delivery systems such as polymer matrices, liposomes, and microspheres.

20 The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior
25 to use.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or
30 carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for

example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution
5 retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i)
10 lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be
15 employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells
20 such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a
25 delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

The active compounds can also be in micro-encapsulated form, if appropriate, with one or more of the above-mentioned excipients.

30 Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups and elixirs. In addition to the active

compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethyl formamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

Suspensions, in addition to the active compounds, may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, and tragacanth, and mixtures thereof.

Dosage forms for topical administration of a compound of this invention include powders, sprays, ointments and inhalants. The active compound is mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers, or propellants which may be

required. Ophthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

5 Anaphylatoxin Receptor Binding K_i Determination

Specific inhibition of C5a binding activity of representative compounds of the present invention was measured using 0.03-1 nM ^{125}I -C5a with 2.5-25 ug/mL of purified PMNL membrane fragments (Borregaard, N.; Heiple, J. M.; Simons, E. R.; and Clark, R. A. *J. Cell. Biol.* 1983, 10 97, 52-61.). Free and membrane-bound ligand were separated by filtration. Synthesis of the Compounds

The novel compounds and salts thereof of the invention can be utilized effectively as therapeutic agents.

Accordingly, the present invention further relates to
5 therapeutic compositions comprising a novel compound having the general formula I or salts thereof as an active component.

The compounds of the invention may be prepared by a synthetic method of elongation of a peptide chain through
10 condensation of one amino acid by one, or by a method of coupling fragments consisting of two or several amino acids, or by a combination of these methods in accordance with conventional peptide synthesis methods.

The condensation of two amino acids, the condensation
15 of an amino acid with a peptide or the condensation of one peptide with another peptide may be effected in accordance with conventional condensation methods such as azide method, mixed acid anhydride method, symmetrical anhydride method, DCC (dicyclohexylcarbodiimide) method, active ester method
20 (p-nitrophenyl ester method, N-hydroxysuccinimide ester method, cyanomethyl ester method and the like), Woodward reagent K method, DCC-HOBT(1-hydroxy-benzotriazole) method and the like. These condensation reactions may be done by either solution methods or solid phase synthetic methods.
25 When the peptide chain is elongated by the solid phase method, the C-terminal amino acid is linked to an insoluble carrier. As the insoluble carrier, any that can produce a detachable bond by reacting with a carboxyl group in a C-terminal amino acid may be used, and the examples thereof
30 involve, for example, halomethyl resins such as chloromethyl resin, bromomethyl resin and the like, hydroxy-methyl resin,

benzhydrylamine resin, and t-alkyloxycarbonyl hydrazide resin.

As conventional polypeptide synthesis, branched chain amino and carboxyl groups at alpha and omega positions in amino acids may be protected/deprotected if necessary. The protecting groups for amino groups which can be used involve, for example, benzyloxycarbonyl (Z), o-chlorobenzyloxycarbonyl ((2-Cl)Z), p-nitrobenzyloxycarbonyl (Z(NO₂)), p-methoxybenzyloxycarbonyl (Z(OMe)), t-butoxycarbonyl (Boc), t-amylloxycarbonyl (Aoc), isobornyloxycarbonyl, adamantyloxycarbonyl, 2-(4-biphenyl)-2-propyloxycarbonyl (Bpoc), 9-fluorenyl-methoxycarbonyl (Fmoc), methylsulfonylethoxycarbonyl (Msc), trifluoroacetyl, phthalyl, formyl, 2-nitrophenylsulfenyl (Nps), diphenylphosphinothioyl (Ppt), and dimethylphosphinothioyl (Mpt).

The examples of protecting groups for carboxyl groups involve, for example, benzyl ester (OBn), cyclohexyl ester, 4-nitrobenzyl ester (OBnNO₂), t-butyl ester (OtBu), 4-picolyl ester (OPic) and the like.

In the course of the synthesis of the present novel compounds, specific amino acids having functional groups other than amino and carboxyl groups in the branched chain such as arginine, cysteine, serine, and the like may be protected, if necessary, with suitable protecting group. It is preferable that for example, the guanidino group (N^G) in arginine may be protected with nitro, p-toluenesulfonyl (Tos), benzyloxycarbonyl (Z), adamantyloxycarbonyl (Adoc), p-methoxybenzenesulfonyl, 4-methoxy-2,6-dimethylbenzenesulfonyl (Mds), 1,3,5-trimethylphenylsulfonyl (Mts) and the like, and the thiol group in cysteine may be protected with benzyl, p-methoxybenzyl, triphenylmethyl, acetamidomethyl,

ethylcarbamyl, 4-methylbenzyl (4-MeBn), 2,4,6-trimethylbenzyl (Tmb) and the like, and the hydroxyl group in serine may be protected with benzyl (Bn), t-butyl, acetyl, tetrahydropyranyl and the like.

5 N-Acetylated peptides were prepared in analogy to Example 120. The following literature procedures were used to prepare N-alkyl- or N,N-dialkyl-amino acid derivatives. Lovett, J. A.; Portoghese, P. *J. Med. Chem.* 1987, 30, 1144-1149. Borch, R. F.; Hassid, A. I. *J. Org. Chem.* 1972, 37, 10 1673-1674. Hansen, D. W.; Pilipauskas, D. *J. Org. Chem.* 1985, 50, 945-950. Grieco, P. A.; Basha, A. *J. Org. Chem.* 1987, 52, 5746-5749. Shuman, R. T.; Smithwick, E. L.; Smiley, D. L.; Brooke, G. S.; Gesellchen, P. D. "Peptide: Structure and Function", Proceedings of the Eighth American 15 Peptide Symposium, 1984; p 143-146. Cheung, S. T.; Benoiton, N. L. *Can. J. Chem.* 1977, 55, 906-910. These reactions were carried out either on the elongated peptide-resin or on amino acid derivatives and then incorporated into the peptide-resin.

20 The preparation of (2RS)-2-amino-5-phenylpentanoic acid is described in: Greenstein, J. P.; Winitz, M. "Chemistry of the Amino Acids"; John Wiley and Sons, Inc.: New York, 1961; Vol III, p.2387.

(N-Boc)-(2R)-2-Amino-3-cyclohexylpropanoic acid: A 25 solution of Boc-D-phenylalanine (50 g, 0.19 mol) in methanol (500 mL) was hydrogenated at room temperature at 4 atms with 5% rhodium on alumina (5.0 g). Removal of catalyst by filtration and evaporation yielded the product quantitatively. The (2S)-isomer was prepared in an 30 identical manner from Boc-L-phenylalanine.

The following literature procedures were used to prepare N-guanidino substituted arginine derivatives:

Mathias, L. J., *Synthesis* 1979, 561-576; Maryanoff, C. A.; Stanzione, R. C.; Plampin; J. M.; Mills, J. E. *J. Org. Chem.* 1986, 51, 1882-1884; Nestor, J. J.; Ho, T. L.; Simpson, R. A.; Horner, B. L.; Jones, G. H.; McRae, G. I.; Vickery, B. H. *J. Med. Chem.* 1982, 25, 795-801. The obtained arginine derivatives were attached to Merrifield resin as described in: Stewart, J. M.; Young, J. D. "Solid Phase Peptide Synthesis", 2nd edition; Pierce Chemical Co.: Rockford, Illinois, 1984; p 71-72. The amino acid resin obtained was used to construct the peptide, followed by cleavage and purification to yield the desired peptide analog.

C-terminal esters and acyl hydrazides were prepared as described in: Stewart, J. M.; Young, J. D. "Solid Phase Peptide Synthesis", 2nd edition; Pierce Chemical Co.: Rockford, Illinois, 1984.

Disulfides were made according to the method described by: Rich, D. H.; Kawai, M.; Goodman, H. L.; Suttie, J. W. *J. Med. Chem.* 1983, 26, 910.

The compounds of the invention were prepared by standard solid phase peptide synthesis conditions as described in "Solid Phase Peptide Synthesis" by J. M. Stewart and J. D. Young, Second Edition (1984) and illustrated in Examples 1 and 2 in the experimental section.

The compounds of the invention may also be prepared by partial solid phase synthesis, fragment condensation methods and classical solution methods as exemplified by the methods described in "Peptide Synthesis", Second Edition, M. Bodanszky, Y. S. Klausner, and M. A. Ondetti (1976).

The standard chirality descriptors "R" and "S" are used to indicate an isomerically pure center, "RS" to indicate a mixture, and "R/S" to indicate a single pure isomer of

undetermined configuration. The descriptor "±" refers to a d,l mixture of amino acids at the indicated residue. The descriptor "*" or "***" when written in a chemical name indicates the site of a disulfide or amide linkage, respectively.

The foregoing may be better understood by reference to the following examples which are provided for illustration and not limitation of the practice of the invention. Unless otherwise indicated, the standard peptide methods described above and in examples 1 and 2 were used to assemble the different products, using the precursors indicated by the specific peptide sequence. The product was at least 95% pure, and gave NMR and mass spectra consistent with the proposed structure.

Example 1

H-Phenylalanyl-Lysyl(N-epsilon-Cbz)-Prolyl-((2R)-2-Amino-3-cyclohexylpropanoyl)-((2S)-2-Amino-3-cyclohexylpropanoyl)-DArginyl(N-guanidino-Tos)-Merrifield Resin

Boc-DArginine(N-guanidino-Tos)-Merrifield resin (0.4-1.0 g) was placed in a solid phase peptide synthesis vessel and amino acids were attached to the resin sequentially in the following order: Boc-(2S)-2-Amino-3-cyclohexylpropanoic acid, Boc-(2R)-2-Amino-3-cyclohexylpropanoic acid, Boc-Proline, (N-alpha-Boc,N-epsilon-Cbz)Lysine, Boc-Phenylalanine, according to the protocol outlined in Agenda A to yield the protected peptide resin: H-Phenylalanyl-Lysyl(N-epsilon-Cbz)-Prolyl-((2R)-2-Amino-3-cyclohexylpropanoyl)-((2S)-2-Amino-3-cyclohexylpropanoyl)-DArginyl(N-guanidino-Tos)-Merrifield resin. Following the synthesis, the protected peptide resin was removed from the reaction vessel by washing the resin three times with 20 mL DMF into a 30-60 mL sintered

glass funnel, followed by washing the resin three times with 20 mL methylene chloride. The resin was dried at least five hours, then weighed.

30 The protected peptide resin of Example 1 (0.6 g) was treated with 1.0 mL anisole and 10 mL hydrogen fluoride (HF) for 60 minutes at 0 °C. The HF and anisole were removed in vacuo at 0 °C, and the mixture of the peptide and resin was washed with diethyl ether (2 x 25 mL). The crude peptide was extracted from the mixture by treatment with portions of 20% aqueous acetic acid (4 x 25 mL), lyophilized to a dry

amorphous powder, and purified by high performance liquid chromatography (HPLC) {column: 21.4 mm ID x 25 cm or 41.4 mm ID x 25 cm, Dynamax (Rainin), 8 μ m silica, C18 reverse-phase column}. The sample was purified by gradient elution {from 20 to 60% (80% acetonitrile in water with 0.1% trifluoroacetic acid)} at a flow rate of 15-45 mL/min. FAB⁺ MS: (M+H)⁺=853

Example 3

N-Boc-D-Arginine hydrochloride (100 mg, 0.3 mmol) was coupled with benzylamine (40 μ L, 0.4 mmol) using the mixed anhydride method described in Example 322 to give N-Boc-D-arginine benzylamide. The Boc group was removed by treatment with 4 M hydrochloric acid in dioxane for 1 h. The resulting D-arginine benzylamide was coupled to N-Boc-(N-methyl)phenylalanyl-lysyl(N-epsilon-Boc)-prolyl-((2R)-2-amino-3-cyclohexylpropanoyl)-((2S)-2-amino-3-cyclohexylpropanoyl)-OH, which was prepared as described in Example 322, using 1-(3-dimethyl-aminopropyl)-3-ethyl carbodiimide hydrochloride in dimethylformamide using the method described in Example 322. The crude product was deprotected with 50% trifluoroacetic acid in methylene chloride. The material thus obtained was purified by HPLC as described in Example 2 to give the title compound in 26% overall yield.

Amino acids were attached to the resin sequentially in the
following order: Boc-phenylalanine, Boc-(2R)-2-amino-3-
cyclohexylpropanoic acid, Boc-proline, (N-alpha-Boc-N-
epsilon-Fmoc)-lysine, and Boc-N-methylphenylalanine. After

washed with DMF (3x10 mL) and 30% formaldehyde aq. solution
15 (0.2 mL, 2.5 mmol) in 0.1% acetic acid in DMF (10 mL) was
added, followed by sodium cyanoborohydride (320 mg, 5 mmol).

The C-terminal pentapeptide is prepared under standard solid phase peptide synthesis conditions. The epsilon nitrogen of lysine is protected as its Fmoc derivative which remains intact during the acidic cleavage of the pentapeptide from the resin. Racemic ((Z)-1-Acetamido-2-

15

phenylcyclopropane)-1-carboxylic acid is prepared from Z-acetamidocinnamic acid according to the methodology given in, Schmidt, U.; Lieberknecht, A.; Wild, J. *Synthesis* 1988, 159-172, and the references cited therein. This amino acid is

20

then coupled in solution phase to the pentapeptide by the mixed acid anhydride method, and the Fmoc group is removed with piperidine. Separation of the diastereomeric products by HPLC furnishes the final product.

The C-terminal pentapeptide is prepared using standard solid phase peptide synthesis techniques. The lysine is incorporated with the epsilon nitrogen protected with Fmoc which survives HF cleavage of the peptide from the resin and removal of the other protecting groups. Z-Acetamidocinnamic acid is coupled to the pentapeptide in solution phase employing the mixed acid anhydride method. The Fmoc group is subsequently removed with piperidine, and the crude peptide is purified by HPLC.

Diphenylphosphoryl azide (25.8 uL, 0.12 mmol) was added followed by triethylamine (70 uL, 0.5 mmol). The mixture was stored in a freezer at -15 °C for 12 d. The dimethylformamide was then removed in vacuo. The resulting oil was purified by HPLC as described in Example 2. The peptide (146 mg, 0.12 mmol) was then dissolved in 40% CH₃CN (30 mL); 1 N HCl (0.5 mL, 0.24 mmol) was added and the mixture was lyophilized to give the hydrochloride salt of the peptide. The resulting white powder was dissolved in dry DMF (15 mL) at -20 °C under N₂. Diphenylphosphoryl azide (30 uL, 0.14 mmol) was added
10 followed by triethylamine (83 uL, 0.6 mmol). The mixture was stored in a freezer at -15 °C for 12 d. The dimethylformamide was then removed in vacuo employing a 40 °C water bath. The resulting oil was purified by HPLC as described in Example 2 to furnish the cyclic peptide in which the epsilon amine of the lysine residue remained protected as its trifluoroacetyl amide. The peptide (43 mg) was dissolved in methanol (2 mL) and water (1.5 mL) and saturated aqueous sodium carbonate solution (0.1 mL) was added. The mixture was stirred overnight at ambient temperature then purified by
15 HPLC to provide the title compound (30 mg, 29%).

(N-Methyl)Phenylalanyl-{Lysyl(N-epsilon-[N-(1,3-Diaminopropyl)carbonyl]]}-Prolyl-((2R)-2-Amino-3-cyclohexylpropanoyl)-Phenylalanyl-DArginyl-OH

The peptide Boc-(N-Methyl)Phenylalanyl-Lysyl(Fmoc)-Prolyl-((2R)-2-Amino-3-cyclohexylpropanoyl)-Phenylalanyl-DArginyl(N-guanidino-Tos)-OResin was synthesized according to the protocol described in Example 1, and the Fmoc protecting group was removed by treatment of the peptide-resin with piperidine according to the method shown in: Stewart, J. M.; Young, J. D. "Solid Phase Peptide Synthesis", 2nd edition; Pierce Chemical Co.: Rockford, Illinois, 1984; p 83. The resin, Boc-(N-Methyl)Phenylalanyl-Lysyl-Prolyl-((2R)-2-Amino-3-cyclohexylpropanoyl)-Phenylalanyl-DArginyl(N-guanidino-Tos)-OResin (2.42 g, ca 0.96 meq), was agitated overnight with a nitrogen stream in a solution of dicarbonyl imidazole (1.6 g in 30 mL dimethylformamide) to form the carbonyl-imidazole derivative of lysine. The resin was then washed with dimethylformamide followed by methylene chloride and finally dried in a vacuum oven at room temperature overnight. The modified peptide-resin (0.74 g, ca 0.25 meq) was swelled with dimethyl-formamide and the solvent removed by filtration. The resin was then agitated overnight with a nitrogen stream in a solution of propanediamine (0.21 mL, 2.5 mmol) in dimethylformamide (20 ml). The resin was removed by filtration, washed with dimethylformamide and methylene chloride, and dried by aspiration. The peptide was then cleaved from the resin by treatment with anhydrous HF and purified by HPLC as described in Example 2 to supply the title compound (20 mg, 7% yield).

Commercially available D-phenylalanine methyl ester hydrochloride (12 g) was hydrogenated with 5% rhodium on carbon (1.2 g) in 250 mL of methyl alcohol to yield (2R)-2-amino-3-cyclohexyl propanoic acid methyl ester hydrochloride
20 in 97% yield. This (5.0 g, 18.4 mmol) was coupled with Boc-L-proline (3.97 g, 18.4 mmole) by standard methods [(1-hydroxybenzotriazole monohydrate (HOBt) (2.74 g, 20 mmol), N-methylmorpholine (NMM) (2.23 mL, 20 mmol) and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) (3.89 g,
25 20 mmol) as exemplified by the methods described in "Peptide Synthesis", Second Edition, Bodanszky, M.; Klausner, Y. S. and Ondetti, M. A., (1976) in 71% yield. The Boc-group was cleaved with 4 N hydrochloric acid in dioxane, and the
30 obtained prolyl-(2R)-2-amino-3-cyclohexylpropanoic acid methyl ester hydrochloride was reacted with N-alpha-Cbz-N-epsilon-Boc-lysine (quantitative yield) according to the method mentioned above. The N-alpha-Cbz group was removed by

hydrogenolysis (20%-palladium on charcoal 10%w/w) in acetic acid-isopropanol, and the obtained product was coupled with Boc-(N-methyl)phenylalanine by the above method to obtain N-Boc-(N-methyl)phenylalanyl-lysyl(N-epsilon-Boc)-prolyl-((2R)-2-amino-3-cyclohexylpropanoic acid methyl ester} in
5 quantitative yield. Finally, the methyl ester (7.33 g, 9.5 mmole) was cleaved by treatment with 1.5 molar equivalents of lithium hydroxide (598 mg, 14.25 mmol) in 115 mL of methanol-water (2:1) mixture to obtain N-Boc-(N-methyl)phenylalanyl-lysyl(N-epsilon-Boc)-prolyl-((2R)-2-amino-3-cyclohexylpropanoic acid} in 83% yield.

N-Boc-(N-methyl)phenylalanyl-lysyl(N-epsilon-Boc)-prolyl-((2R)-2-amino-3-cyclohexylpropanoic acid (1.5 g, 2
15 mmol) was reacted with phenylalanine methyl ester hydrochloride in tetrahydrofuran by the mixed anhydride method (isobutylchloroformate and N-methylmorpholine) as exemplified by the methods described in "Peptide Synthesis", Second Edition, Bodanszky, M.; Klausner, Y. S. and Ondetti, M. A., (1976) to obtain N-Boc-(N-methyl)phenylalanyl-lysyl(N-epsilon-Boc)-prolyl-((2R)-2-amino-3-cyclohexylpropanoyl-phenylalanine methyl ester in quantitative yield. The methyl
20 ester (1.7 g, 1.8 mmole) was saponified with 1.5 equivalents of lithium hydroxide (160 mg, 2.7 mmole) in 20 mL of methanol and water (2:1) according to the procedure described above to
25 yield N-Boc-(N-methyl)phenylalanyl-lysyl(N-epsilon-Boc)-prolyl-((2R)-2-amino-3-cyclohexylpropanoyl)-phenylalanyl-OH in 99% yield.

N-Boc-(N-Methyl)Phenylalanyl-Lysyl(N-epsilon-Boc)-Prolyl-((2R)-2-Amino-3-cyclohexylpropanoyl)-Phenylalanyl-OH (0.18 mmol) was dissolved in 3 mL of methylene chloride at
30 -20 °C, and triethylamine (25 uL, 0.18 mmol) and

isobutylchloroformate (25 uL, 0.18 mmol) were added. After D-4-nitrophenylalanine (0.3 mmol) in 1 mL of dimethylformamide containing triethylamine (41.8 uL, 0.3 mmol) was added, the reaction was carried out at 20 °C for 1 h and at room temperature for one overnight. Solvent was removed and the residue was dissolved in ethyl acetate which was washed with brine, 10% potassium hydrogen sulfate, brine and dried over magnesium sulfate. Solvent was removed and the residue was treated with 4 N hydrochloric acid in dioxane to yield a crude title compound. HPLC purification gave the pure title compound.

(N-alpha-Boc, N-delta-Cbz)Ornithine was converted to its benzyl ester in 98% yield (mass spectrum, m/e 457[M+H]) according to: Wang, S-S.; Gisin, B. F.; Winter, D. P.; Makojske, R.; Kulesha, I. D.; Tzougraki, C.; Meienhofer, J. 15 J. Org. Chem. 1977, 42, 1286-1290. The Boc group was removed by treatment with 4 N hydrochloric acid in dioxane over 1 h. Benzylation on the alpha carbon was accomplished using a solid-liquid catalytic phase-transfer alkylation procedure: O'Donnell, M. J.; LeClef, B.; Rusterholz, D. B. 20 Tetrahedron Lett. 1982, 23, 4259-4262. This supplied (R/S)-(N-delta-Cbz)-2-benzyl-ornithine benzyl ester in 75% yield: ¹H NMR (CDCl₃, 300 MHz) δ 1.3 (m, 1 H), 1.6 (m, 2 H), 1.93 (m, 1 H), 2.25 (d, 1 H), 3.15 (m, 3 H), 4.8 (b. 1 H), 5.1 (m, 4 H), 7.05 (m, 2 H), 7.2 (m, 3 H), 7.35 (m, 10 H); mass 25 spectrum, m/e 447(M+H). The above compound was coupled in 41% yield using 1-(3-dimethyl-aminopropyl)-3-ethyl carbodiimide hydrochloride to N-Boc-(N-Methyl)Phenylalanyl-Lysyl(N-epsilon-Boc)-Prolyl-((2R)-2-Amino-3-cyclohexylpropanoyl)-((2S)-2-Amino-3-cyclohexylpropanoic 30 acid) which was prepared by methodology described in Example 322: FAB⁺ MS: (M+H)⁺=1339. Synthesis 1988, 91-95. Guanidination of the delta amine of the ornithine residue was accomplished according to the procedure of Salvadori, S.; Sarto, G. P.; Tomatis, R. *Eur. J. Med. Chem.-Chim. Ther.* 1983, 18, 489-493. The Boc groups were removed with 50% trifluoroacetic acid in methylene chloride to supply the title compounds. Besides the diastereomeric pair created by coupling of racemic 2-benzyl-ornithine, racemization occurred at the adjacent residue.
